```

Overview

- Learning to use the **command line**
- **New ways to get input** into your programs:
 - Read information **from user**
 - Read information **from a file**
 - Read information **from another program**
- **New way to store things**
 - **Arrays**: store multiple things under one name
 - e.g. `args[0]`, `args[1]`, `args[2]`

Interfacing with your computer

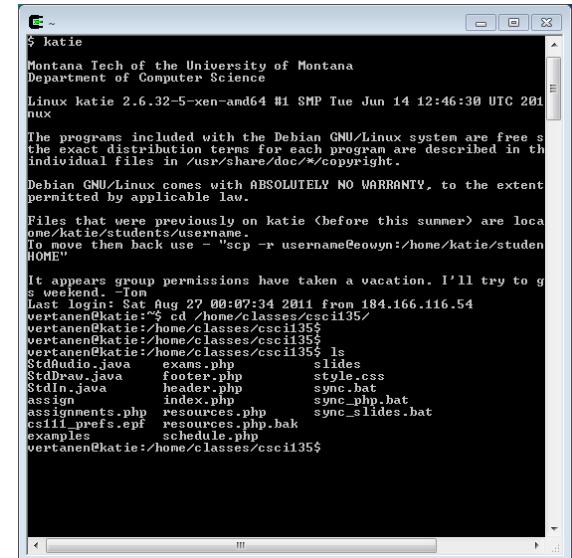

- **GUI (graphical user interfaces)**
 - Today: predominant interaction method
 - Windows, buttons, mouse
 - Advantages
 - Easier for novices
 - No commands to remember
 - Rich input and output capabilities

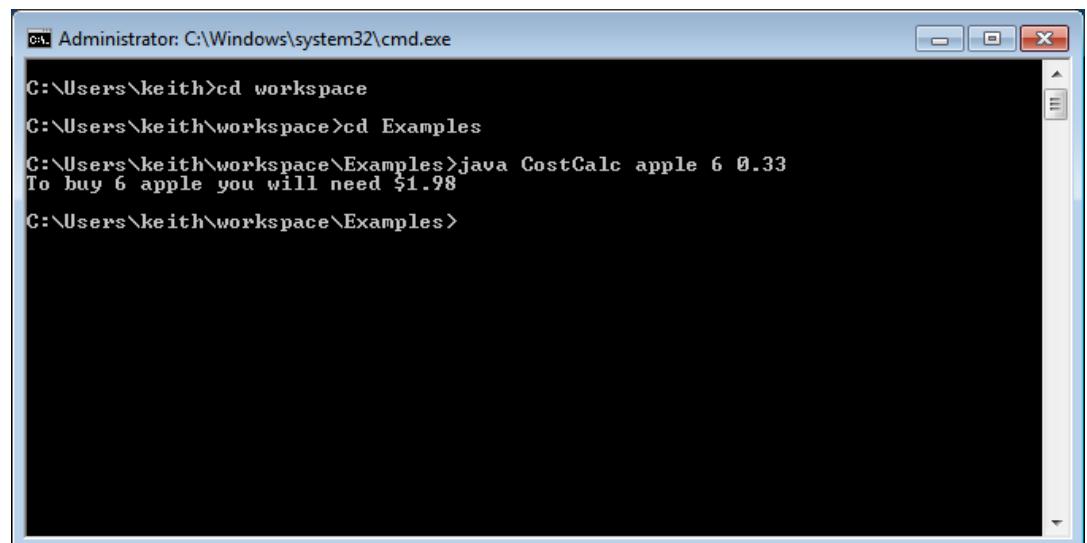

Interfacing with your computer

- Command line interface (CLI)

- Originally the only option
- Input by **typing commands**
- Advantages:
 - Can be **faster for experts than a GUI**
 - Easier to **automate tasks**
 - Easier to **hook programs together**

Getting around the command line

Action	Windows	Mac OS / Unix
Move into a folder	cd myfolder	cd myfolder
Move into parent folder	cd ..	cd ..
Move into a folder, absolute folder	cd \Users\keith	cd /Users/keith
List files in current folder	dir	ls
Compile program in current folder	javac Prog.java	javac Prog.java
Run a compiled program	java Prog	java Prog
See what is in a text file	type Prog.java	more Prog.java
Auto-complete filenames	<tab key>	<tab key>
Last command	<up arrow>	<up arrow>

Input via command line

- Input via args[] array
 - Tedious to enter lots of input
 - Impossible to have interactive user input
 - e.g. What we need for a number hunting game

```
% java NumberHunt
Guess a number between 1-100? 50
Ice cold.
Guess a number between 1-100? 20
Getting warmer.
Guess a number between 1-100? 10
Hot.
Guess a number between 1-100? 5
Getting warmer.
Guess a number between 1-100? 15
Hot.
Guess a number between 1-100? 12
You nailed it!
It took you 6 guesses.
```

Standard input class

- Allows input **from user** or **from a file**
- Download StdIn.java
 - Place in **same directory** as your program
 - Refresh **Eclipse** project to make it show up

```
public class AddTwo
{
    public static void main(String [] args)
    {
        System.out.print("Enter first integer: ");
        int num1 = StdIn.readInt();

        System.out.print("Enter second integer: ");
        int num2 = StdIn.readInt();

        int sum = num1 + num2;
        System.out.println("Sum = " + sum);
    }
}
```

Standard input class

- Reading from a file via **redirection**
 - Need to do from command line
 - Can't redirect file (easily) inside Eclipse
- **Goal: Sum all integers in a file**
 - Keep reading numbers until End Of File (EOF)
 - EOF can be sent by hitting ctrl-z or ctrl-d in Eclipse

```
public class SumNums
{
    public static void main(String [] args)
    {
        int sum = 0;
        while (!StdIn.isEmpty())
        {
            sum += StdIn.readInt();
        }
        System.out.println("Sum = " + sum);
    }
}
```

Reading from a file

```
Administrator: C:\Windows\system32\cmd.exe
C:\Users\keith\workspace\Examples\src>javac SumNums.java
C:\Users\keith\workspace\Examples\src>more nums5.txt
1
3
5
7
9
C:\Users\keith\workspace\Examples\src>java SumNums < nums5.txt
Sum = 25
C:\Users\keith\workspace\Examples\src>
```

StdIn.java

```
public class StdIn
```

boolean	<i>isEmpty()</i>	true if no more values, false otherwise
int	<i>readInt()</i>	read next int
double	<i>readDouble()</i>	read next double
long	<i>readLong()</i>	read next long
boolean	<i>readBoolean()</i>	read next boolean
char	<i>readChar()</i>	read next char
String	<i>readString()</i>	read next String
String	<i>readLine()</i>	read rest of line (until carriage return)
String	<i>readAll()</i>	read the rest of the text

```
this is an example text file  
1.23 3.45  
10 20  
the  
end
```

Combining programs

- Output can also be **redirected**
 - To a file (for later review) via redirection
 - Directly to another program via piping
- Example:
 - First program generates random numbers
 - Second program averages the numbers

Combining programs

```
public class RandomNums
{
    public static void main(String [] args)
    {
        int num = Integer.parseInt(args[0]);
        for (int i = 0; i < num; i++)
            System.out.println(Math.random());
    }
}
```

```
public class AvgNums
{
    public static void main(String [] args)
    {
        double sum    = 0.0;
        long   count = 0;
        while (!StdIn.isEmpty())
        {
            sum += StdIn.readDouble();
            count++;
        }
        System.out.println(sum / count);
    }
}
```

Averaging random numbers

```
Administrator: C:\Windows\system32\cmd.exe
C:\Users\keith\workspace\Examples\src>javac RandomNums.java
C:\Users\keith\workspace\Examples\src>java RandomNums 5
0.749886559151749
0.9855603824980105
0.0905265363837987

0.5026434192031748

C:\Users\keith\workspace\Examples\src>java RandomNums 100000 | java AvgNums
0.5001690805180232

C:\Users\keith\workspace\Examples\src>
```

Reading input from
file using < followed
by the filename.

Directly **piping output**
from one program to
another using pipe |

Enter the zombies...

<http://www.flickr.com/photos/purplemattfish/4075367455/>

Zombie Apocalypse

Level: 0

```
..!.  
.....  
.....  
.....  
....*..  
.....  
.....  
.....  
.....#  
Direction? s  
You walked south  
Zombie went east
```

How do I keep track of location of the person and the zombie?

```
int personX = 0;  
int personY = 0;  
  
int zombieX = 0;  
int zombieY = 0;
```

How do I detect when the person gets eaten?

```
if ((personX == zombieX) && (personY == zombieY))  
{  
    System.out.println("Zombie got your braaaains!");  
    gameOver = true;  
}
```

Extreme Zombie Apocalypse

.....#  
Direction? s  
You walked south  
Zombie went east
```

What if we need to keep track of three zombies?

```
int personX = 0;
int personY = 0;

int zombieX1 = 0;
int zombieY1 = 0;

int zombieX2 = 0;
int zombieY2 = 0;

int zombieX3 = 0;
int zombieY3 = 0;

...

if (((personX == zombieX1) && (personY == zombieY1)) ||
    ((personX == zombieX2) && (personY == zombieY2)) ||
    ((personX == zombieX3) && (personY == zombieY3)))
{
    System.out.println("Zombie got your braaaaains!");
    gameOver = true;
}
```

Zombie Apocalypse: The Rising

You walked south
Zombie went west
Level: 5

```
. * . * .  
. . . * .  
! . * . .  
* . . . .  
. . * . #
```

Direction?

What if we want to add one zombie every time the player advances a level?

No good way to do this with simple variables!

Arrays to the rescue!

- We've already seen **arrays**:

```
public static void main(String [] args)
```

```
% java CostCalc bananas 12 0.21  
To buy 12 bananas you will need $2.52
```

identifier	meaning	value	type
args[0]	1 st thing on command line after Java class name	"bananas"	String
args[1]	2 nd thing on command line	"12"	String
args[2]	3 rd thing on command line after Java class	"0.21"	String
args.length	# of things on command line	3	int

Arrays: creating many things

- **Arrays:** create many variables of same type
- **Goal:** Ten variables of same type
 - e.g. To hold the values 0-9

```
int a0, a1, a2, a3, a4, a5, a6, a7, a8, a9;  
a0 = 0;  
a1 = 1;  
a2 = 2;  
a3 = 3;  
a4 = 4;  
a5 = 5;  
a6 = 6;  
a7 = 7;  
a8 = 8;  
a9 = 9;
```

Arrays: creating many things

- **Arrays:** create many variables of same type
- **Goal:** Ten variables of same type
 - e.g. To hold the values 0-9

```
int [] a = new int[10];
a[0] = 0;
a[1] = 1;
a[2] = 2;
a[3] = 3;
a[4] = 4;
a[5] = 5;
a[6] = 6;
a[7] = 7;
a[8] = 8;
a[9] = 9;
```

new keyword is used
whenever we create an array

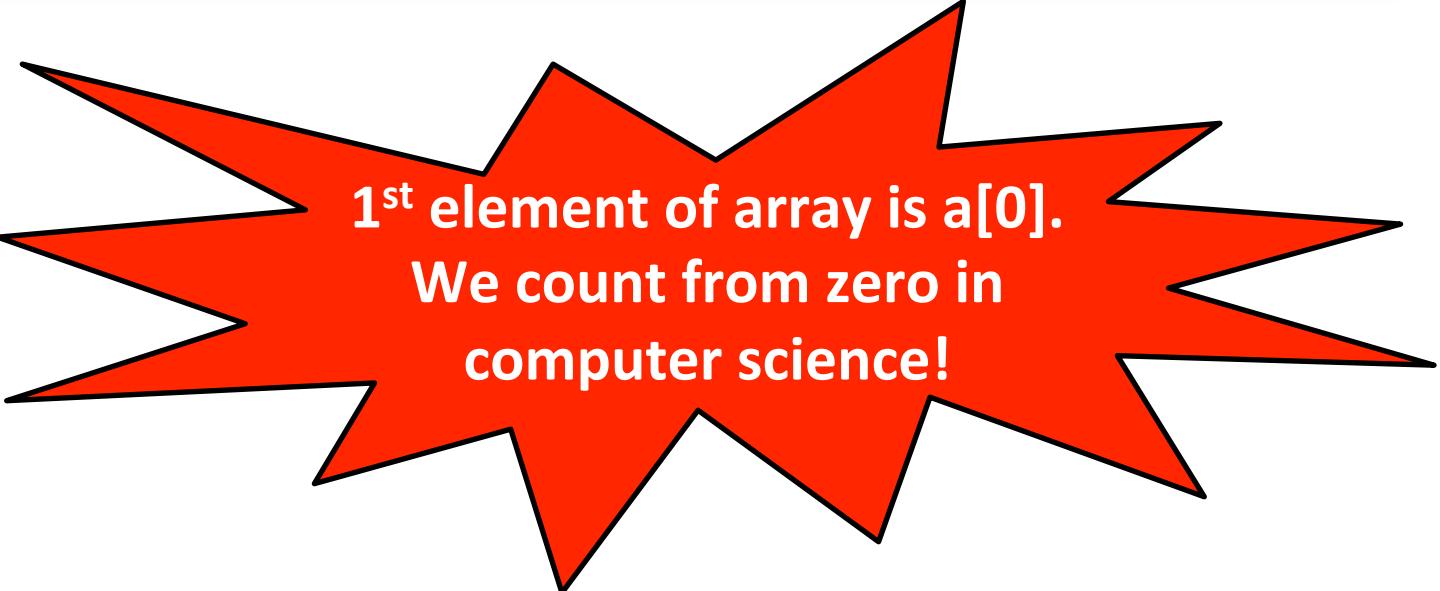

Arrays: accessing elements

- **Arrays:** we can use a variable as the index!
 - Makes code shorter, cleaner, less buggy

```
int N = 10;                      // size of array
int [] a;                         // declare array
a = new int[N];                   // create array

for (int i = 0; i < a.length; i++) // initialize array elements
    a[i] = i;                     // to be 0 - 9
```

1st element of array is a[0].
We count from zero in
computer science!

Arrays: easy to extend

- **Arrays:** can hold lots and lots of data
 - Same code, but now holds 100,000 integers:

```
int N = 100000;           // size of array
int [] a;                 // declare array
a = new int[N];           // create array

for (int i = 0; i < a.length; i++) // initialize array elements
    a[i] = i;               // to be 0 - 9
```

Arrays: loading data from file

```
4
fee
fi
fo
fum
```

4words.txt

"There are going to be 4
words to read in"

- Read words into array
- Print out words in reverse order

```
% java Backwards < 4words.txt
fum fo fi fee
```

Arrays: loading data from file

```
4  
fee  
fi  
fo  
fum
```

```
% java PrintBackward < 4words.txt  
fum fo fi fee
```

```
public class Backwards  
{  
    public static void main(String [] args)  
    {  
        int num = StdIn.readInt();  
        String [] words = new String[num];  
  
        for (int i = 0; i < num; i++)  
            words[i] = StdIn.readString();  
  
        for (int i = num - 1; i >= 0; i--)  
            System.out.print(words[i] + " ");  
        System.out.println();  
    }  
}
```

Super Extreme Zombie Apocalypse

        gameOver = true;
    }
    i++;
}
```

Summary

- Command line
 - Redirect **output** to a file
 - Redirect **input** from a file
 - Pipe output between programs
- Standard input
 - Easy way to **read** from user or file
- Arrays
 - Allow easy **storage** of similar data
 - Crucial for developing more advanced programs
