

# Probability

# Our Status

- We're done with Part I Search and Planning!

- Part II: Probabilistic Reasoning

- Diagnosis
- Speech recognition
- Tracking objects
- Robot mapping
- Genetics
- Error correcting codes
- ... lots more!

- Part III: Machine Learning

# Today

- Probability
  - Random Variables
  - Joint and Marginal Distributions
  - Conditional Distribution
  - Product Rule, Chain Rule, Bayes' Rule
  - Inference
  - Independence
- You'll need all this stuff A LOT for the next few weeks, so make sure you go over it now!

# Inference in Ghostbusters

- A ghost is in the grid somewhere
- Sensor readings tell how close a square is to the ghost
  - On the ghost: red
  - 1 or 2 away: orange
  - 3 or 4 away: yellow
  - 5+ away: green
- Sensors are noisy, but we know  $P(\text{Color} \mid \text{Distance})$

| $P(\text{red} \mid 3)$ | $P(\text{orange} \mid 3)$ | $P(\text{yellow} \mid 3)$ | $P(\text{green} \mid 3)$ |
|------------------------|---------------------------|---------------------------|--------------------------|
| 0.05                   | 0.15                      | 0.5                       | 0.3                      |

# Uncertainty

- General situation:
  - **Observed variables (evidence):** Agent knows certain things about the state of the world (e.g., sensor readings or symptoms)
  - **Unobserved variables:** Agent needs to reason about other aspects (e.g. where an object is or what disease is present)
  - **Model:** Agent knows something about how the known variables relate to the unknown variables
- Probabilistic reasoning gives us a framework for managing our beliefs and knowledge

|      |      |      |
|------|------|------|
| 0.11 | 0.11 | 0.11 |
| 0.11 | 0.11 | 0.11 |
| 0.11 | 0.11 | 0.11 |

|       |      |      |
|-------|------|------|
| 0.17  | 0.10 | 0.10 |
| 0.09  | 0.17 | 0.10 |
| <0.01 | 0.09 | 0.17 |

|       |       |      |
|-------|-------|------|
| <0.01 | <0.01 | 0.03 |
| <0.01 | 0.05  | 0.05 |
| <0.01 | 0.05  | 0.81 |

# Random Variables

- A random variable is some aspect of the world about which we (may) have uncertainty
  - $R$  = Is it raining?
  - $T$  = Is it hot or cold?
  - $D$  = How long will it take to drive to work?
  - $L$  = Where is the ghost?
- We denote random variables with capital letters
- Like variables in a CSP, random variables have domains
  - $R$  in  $\{\text{true}, \text{false}\}$  (often write as  $\{+r, -r\}$ )
  - $T$  in  $\{\text{hot}, \text{cold}\}$
  - $D$  in  $[0, \infty)$
  - $L$  in possible locations, maybe  $\{(0,0), (0,1), \dots\}$

# Probability Distributions

- Associate a probability with each value

- Temperature:

$P(T)$

| T    | P   |
|------|-----|
| hot  | 0.5 |
| cold | 0.5 |

- Weather:

$P(W)$

| W      | P   |
|--------|-----|
| sun    | 0.6 |
| rain   | 0.1 |
| fog    | 0.3 |
| meteor | 0.0 |

# Probability Distributions

- Unobserved random variables have distributions

$$P(T)$$

| T    | P   |
|------|-----|
| hot  | 0.5 |
| cold | 0.5 |

$$P(W)$$

| W      | P   |
|--------|-----|
| sun    | 0.6 |
| rain   | 0.1 |
| fog    | 0.3 |
| meteor | 0.0 |

Shorthand notation:

$$P(\textit{hot}) = P(T = \textit{hot}),$$

$$P(\textit{cold}) = P(T = \textit{cold}),$$

$$P(\textit{rain}) = P(W = \textit{rain}),$$

...

OK if all domain entries are unique

- A distribution is a TABLE of probabilities of values
- A probability (lower case value) is a single number

$$P(W = \textit{rain}) = 0.1$$

- Must have:  $\forall x \ P(X = x) \geq 0$  and  $\sum_x P(X = x) = 1$

# Joint Distributions

- A *joint distribution* over a set of random variables:  $X_1, X_2, \dots, X_n$  specifies a real number for each assignment (or *outcome*):

$$P(X_1 = x_1, X_2 = x_2, \dots, X_n = x_n)$$

$$P(x_1, x_2, \dots, x_n)$$

- Must obey:  $P(x_1, x_2, \dots, x_n) \geq 0$

$$\sum_{(x_1, x_2, \dots, x_n)} P(x_1, x_2, \dots, x_n) = 1$$

$P(T, W)$

| T    | W    | P   |
|------|------|-----|
| hot  | sun  | 0.4 |
| hot  | rain | 0.1 |
| cold | sun  | 0.2 |
| cold | rain | 0.3 |

- Size of distribution if n variables with domain sizes d?
  - For all but the smallest distributions, impractical to write out!

# Probabilistic Models

- A probabilistic model is a joint distribution over a set of random variables
- Probabilistic models:
  - (Random) variables with domains
  - Assignments are called *outcomes*
  - Joint distributions: say whether assignments (outcomes) are likely
  - *Normalized*: sum to 1.0
  - Ideally: only certain variables directly interact
- Constraint satisfaction problems:
  - Variables with domains
  - Constraints: state whether assignments are possible
  - Ideally: only certain variables directly interact

Distribution over T,W

| T    | W    | P   |
|------|------|-----|
| hot  | sun  | 0.4 |
| hot  | rain | 0.1 |
| cold | sun  | 0.2 |
| cold | rain | 0.3 |

Constraint over T,W

| T    | W    | P |
|------|------|---|
| hot  | sun  | T |
| hot  | rain | F |
| cold | sun  | F |
| cold | rain | T |

# Events

- An *event* is a set  $E$  of outcomes

$$P(E) = \sum_{(x_1 \dots x_n) \in E} P(x_1 \dots x_n)$$

- From a joint distribution, we can calculate the probability of any event
  - Probability that it's hot AND sunny?  
0.4
  - Probability that it's hot?  
 $0.4 + 0.1 = 0.5$
  - Probability that it's hot OR sunny?  
 $0.4 + 0.1 + 0.2 = 0.7$
- Typically, the events we care about are *partial assignments*, like  $P(T=\text{hot})$

$P(T, W)$

| T    | W    | P   |
|------|------|-----|
| hot  | sun  | 0.4 |
| hot  | rain | 0.1 |
| cold | sun  | 0.2 |
| cold | rain | 0.3 |

# Quiz: Events

- $P(+x, +y)$  ?

0.2

- $P(+x)$  ?

$0.2 + 0.3 = 0.5$

- $P(-y \text{ OR } +x)$  ?

$0.2 + 0.3 + 0.1 = 0.6$

$P(X, Y)$

| X  | Y  | P   |
|----|----|-----|
| +x | +y | 0.2 |
| +x | -y | 0.3 |
| -x | +y | 0.4 |
| -x | -y | 0.1 |

# Marginal Distributions

- Marginal distributions are sub-tables which eliminate variables
- Marginalization (summing out): Combine collapsed rows by adding

$P(T, W)$

| T    | W    | P   |
|------|------|-----|
| hot  | sun  | 0.4 |
| hot  | rain | 0.1 |
| cold | sun  | 0.2 |
| cold | rain | 0.3 |

$$P(t) = \sum_s P(t, s)$$

$P(T)$

| T    | P   |
|------|-----|
| hot  | 0.5 |
| cold | 0.5 |

$$P(s) = \sum_t P(t, s)$$

$P(W)$

| W    | P   |
|------|-----|
| sun  | 0.6 |
| rain | 0.4 |

$$P(X_1 = x_1) = \sum_{x_2} P(X_1 = x_1, X_2 = x_2)$$

# Quiz: Marginal Distributions

$P(X, Y)$

| X  | Y  | P   |
|----|----|-----|
| +x | +y | 0.2 |
| +x | -y | 0.3 |
| -x | +y | 0.4 |
| -x | -y | 0.1 |

$$P(x) = \sum_y P(x, y)$$

$P(X)$

| X  | P                 |
|----|-------------------|
| +x | $0.2 + 0.3 = 0.5$ |
| -x | $0.4 + 0.1 = 0.5$ |

$$P(y) = \sum_x P(x, y)$$

$P(Y)$

| Y  | P                 |
|----|-------------------|
| +y | $0.2 + 0.4 = 0.6$ |
| -y | $0.3 + 0.1 = 0.4$ |

# Conditional Probabilities

- A simple relation between joint and conditional probabilities
  - In fact, this is taken as the *definition* of a conditional probability
  - $P(a|b)$  = “probability of a happening given b happened”

$$P(a|b) = \frac{P(a, b)}{P(b)}$$

$P(T, W)$

| T    | W    | P   |
|------|------|-----|
| hot  | sun  | 0.4 |
| hot  | rain | 0.1 |
| cold | sun  | 0.2 |
| cold | rain | 0.3 |

$$P(W = s|T = c) = \frac{P(W = s, T = c)}{P(T = c)} = \frac{0.2}{0.5} = 0.4$$

$$\begin{aligned} &= P(W = s, T = c) + P(W = r, T = c) \\ &= 0.2 + 0.3 = 0.5 \end{aligned}$$

# Quiz: Conditional Probabilities

$P(X, Y)$

| X  | Y  | P   |
|----|----|-----|
| +x | +y | 0.2 |
| +x | -y | 0.3 |
| -x | +y | 0.4 |
| -x | -y | 0.1 |

■  $P(+x \mid +y) ?$   $\frac{P(+x, +y)}{P(+y)} = \frac{0.2}{0.2 + 0.4} = \frac{1}{3}$

■  $P(-x \mid +y) ?$   $\frac{P(-x, +y)}{P(+y)} = \frac{0.4}{0.2 + 0.4} = \frac{2}{3}$

$$1 - P(+x \mid +y) = \frac{2}{3}$$

■  $P(-y \mid +x) ?$   $\frac{P(-y, +x)}{P(+x)} = \frac{0.3}{0.2 + 0.3} = \frac{3}{5}$

# Conditional Distributions

- Conditional distributions are probability distributions over some variables given fixed values of others

Conditional Distributions

$P(W|T)$

| $P(W T = hot)$ |     |
|----------------|-----|
| W              | P   |
| sun            | 0.8 |
| rain           | 0.2 |

$P(W = sun | T = hot)$   
 $P(W = rain | T = hot)$

| $P(W T = cold)$ |     |
|-----------------|-----|
| W               | P   |
| sun             | 0.4 |
| rain            | 0.6 |

$P(W = sun | T = cold)$   
 $P(W = rain | T = cold)$

Joint Distribution

$P(T, W)$

| T    | W    | P   |
|------|------|-----|
| hot  | sun  | 0.4 |
| hot  | rain | 0.1 |
| cold | sun  | 0.2 |
| cold | rain | 0.3 |

# Normalization Trick

- Going from a joint distribution to a conditional distribution

$$\begin{aligned}P(W = s|T = c) &= \frac{P(W = s, T = c)}{P(T = c)} \\ &= \frac{P(W = s, T = c)}{P(W = s, T = c) + P(W = r, T = c)} \\ &= \frac{0.2}{0.2 + 0.3} = 0.4\end{aligned}$$

$P(T, W)$

| T    | W    | P   |
|------|------|-----|
| hot  | sun  | 0.4 |
| hot  | rain | 0.1 |
| cold | sun  | 0.2 |
| cold | rain | 0.3 |

$P(W|T = c)$

| W    | P   |
|------|-----|
| sun  | 0.4 |
| rain | 0.6 |

$$\begin{aligned}P(W = r|T = c) &= \frac{P(W = r, T = c)}{P(T = c)} \\ &= \frac{P(W = r, T = c)}{P(W = s, T = c) + P(W = r, T = c)} \\ &= \frac{0.3}{0.2 + 0.3} = 0.6\end{aligned}$$

# Normalization Trick

$$\begin{aligned} P(W = s|T = c) &= \frac{P(W = s, T = c)}{P(T = c)} \\ &= \frac{P(W = s, T = c)}{P(W = s, T = c) + P(W = r, T = c)} \\ &= \frac{0.2}{0.2 + 0.3} = 0.4 \end{aligned}$$

$P(T, W)$

| T    | W    | P   |
|------|------|-----|
| hot  | sun  | 0.4 |
| hot  | rain | 0.1 |
| cold | sun  | 0.2 |
| cold | rain | 0.3 |

**SELECT** the joint probabilities matching the evidence

$P(c, W)$

| T    | W    | P   |
|------|------|-----|
| cold | sun  | 0.2 |
| cold | rain | 0.3 |

**NORMALIZE** the selection (make it sum to one)

$P(W|T = c)$

| W    | P   |
|------|-----|
| sun  | 0.4 |
| rain | 0.6 |

$$\begin{aligned} P(W = r|T = c) &= \frac{P(W = r, T = c)}{P(T = c)} \\ &= \frac{P(W = r, T = c)}{P(W = s, T = c) + P(W = r, T = c)} \\ &= \frac{0.3}{0.2 + 0.3} = 0.6 \end{aligned}$$

# Normalization Trick

$P(T, W)$

| T    | W    | P   |
|------|------|-----|
| hot  | sun  | 0.4 |
| hot  | rain | 0.1 |
| cold | sun  | 0.2 |
| cold | rain | 0.3 |

**SELECT** the joint probabilities matching the evidence

$P(c, W)$

| T    | W    | P   |
|------|------|-----|
| cold | sun  | 0.2 |
| cold | rain | 0.3 |

**NORMALIZE** the selection (make it sum to one)

$P(W|T = c)$

| W    | P   |
|------|-----|
| sun  | 0.4 |
| rain | 0.6 |

- Why does this work? Sum of selection is  $P(\text{evidence})!$  ( $P(T=c)$ , here)

$$P(x_1|x_2) = \frac{P(x_1, x_2)}{P(x_2)} = \frac{P(x_1, x_2)}{\sum_{x_1} P(x_1, x_2)}$$

# Quiz: Normalization Trick

- $P(X | Y=-y)$  ?

$P(X, Y)$

| X  | Y  | P   |
|----|----|-----|
| +x | +y | 0.2 |
| +x | -y | 0.3 |
| -x | +y | 0.4 |
| -x | -y | 0.1 |

**SELECT** the joint probabilities matching the evidence

| X  | Y  | P   |
|----|----|-----|
| +x | -y | 0.3 |
| -x | -y | 0.1 |

**NORMALIZE** the selection  
(make it sum to one)

| X  | $P(X -y)$        |
|----|------------------|
| +x | $0.3/0.4 = 0.75$ |
| -x | $0.1/0.4 = 0.25$ |

# To Normalize

- (Dictionary) To bring or restore to a normal condition

All entries sum to ONE

- Procedure:

- Step 1: Compute  $Z = \text{sum over all entries}$
- Step 2: Divide every entry by  $Z$

- Example 1

- Example 2

# Probabilistic Inference

- Probabilistic inference: compute a desired probability from other known probabilities (e.g. conditional from joint)
- We generally compute conditional probabilities
  - $P(\text{on time} \mid \text{no reported accidents}) = 0.90$
  - These represent the agent's *beliefs* given the evidence
- Probabilities change with new evidence:
  - $P(\text{on time} \mid \text{no accidents, 5 a.m.}) = 0.95$
  - $P(\text{on time} \mid \text{no accidents, 5 a.m., raining}) = 0.80$
  - Observing new evidence causes *beliefs to be updated*

# Inference by Enumeration

- General case:

- Evidence variables:  $E_1 \dots E_k = e_1 \dots e_k$
  - Query\* variable:  $Q$
  - Hidden variables:  $H_1 \dots H_r$
- }  $X_1, X_2, \dots, X_n$   
All variables

- We want:

$$P(Q|e_1 \dots e_k)$$

*\* Works fine with multiple query variables, too*

- Step 1: Select the entries consistent with the evidence

- Step 2: Sum out H to get joint of Query and evidence

- Step 3: Normalize

$$\times \frac{1}{Z}$$

$$P(Q, e_1 \dots e_k) = \sum_{h_1 \dots h_r} \underbrace{P(Q, h_1 \dots h_r, e_1 \dots e_k)}_{X_1, X_2, \dots, X_n}$$

$$Z = \sum_q P(Q, e_1 \dots e_k)$$

$$P(Q|e_1 \dots e_k) = \frac{1}{Z} P(Q, e_1 \dots e_k)$$

# Inference by Enumeration

- $P(W)$ ?

$Q = \{W\}, E = \{\}, H = \{S, T\}$

| W    | P(W)                               |
|------|------------------------------------|
| sun  | $0.30 + 0.10 + 0.10 + 0.15 = 0.65$ |
| rain | $0.05 + 0.05 + 0.05 + 0.20 = 0.35$ |

- $P(W \mid \text{winter})$ ?

$Q = \{W\}, E = \{S\}, H = \{T\}$

| W    | $P(W \mid \text{winter})$     |
|------|-------------------------------|
| sun  | $(0.10 + 0.15) / 0.50 = 0.50$ |
| rain | $(0.05 + 0.20) / 0.50 = 0.50$ |

- $P(W \mid \text{winter, hot})$ ?

$Q = \{W\}, E = \{S, T\}, H = \{\}$

| W    | $P(W \mid \text{winter, hot})$ |
|------|--------------------------------|
| sun  | $0.10 / 0.15 = 2/3$            |
| rain | $0.05 / 0.15 = 1/3$            |

| S      | T    | W    | P    |
|--------|------|------|------|
| summer | hot  | sun  | 0.30 |
| summer | hot  | rain | 0.05 |
| summer | cold | sun  | 0.10 |
| summer | cold | rain | 0.05 |
| winter | hot  | sun  | 0.10 |
| winter | hot  | rain | 0.05 |
| winter | cold | sun  | 0.15 |
| winter | cold | rain | 0.20 |

# Inference by Enumeration

---

- Obvious problems:
  - Worst-case time complexity  $O(d^n)$
  - Space complexity  $O(d^n)$  to store the joint distribution

# The Product Rule

- Sometimes have conditional distributions but want the joint

$$P(y)P(x|y) = P(x, y) \quad \longleftrightarrow \quad P(x|y) = \frac{P(x, y)}{P(y)}$$

# The Product Rule

$$P(y)P(x|y) = P(x, y)$$

- Example:

$P(W)$

| R    | P   |
|------|-----|
| sun  | 0.8 |
| rain | 0.2 |

$P(D|W)$

| D   | W    | P   |
|-----|------|-----|
| wet | sun  | 0.1 |
| dry | sun  | 0.9 |
| wet | rain | 0.7 |
| dry | rain | 0.3 |

$P(D, W)$

| D   | W    | P |
|-----|------|---|
| wet | sun  |   |
| dry | sun  |   |
| wet | rain |   |
| dry | rain |   |

# The Chain Rule

- More generally, can always write any joint distribution as an incremental product of conditional distributions

$$P(x_1, x_2, x_3) = P(x_1)P(x_2|x_1)P(x_3|x_1, x_2)$$

$$P(x_1, x_2, \dots, x_n) = \prod_i P(x_i|x_1 \dots x_{i-1})$$

- Why is this always true?

$$P(x_1, x_2, x_3) = P(x_1)P(x_2|x_1)P(x_3|x_1, x_2) = P(x_1) \frac{P(x_2, x_1)}{P(x_1)} \frac{P(x_3, x_1, x_2)}{P(x_1, x_2)}$$

# Bayes Rule

# Bayes' Rule

- Two ways to factor a joint distribution over two variables:

$$P(x, y) = P(x|y)P(y) = P(y|x)P(x)$$

- Dividing, we get:

$$P(x|y) = \frac{P(y|x)P(x)}{P(y)}$$

- Why is this at all helpful?
  - Lets us build one conditional from its reverse
  - Often one conditional is tricky but the other one is simple
  - Foundation of many systems we'll see later (e.g. ASR, MT)
- In the running for most important AI equation!

That's my rule!

# Inference with Bayes' Rule

- Example: Diagnostic probability from causal probability:

$$P(\text{cause}|\text{effect}) = \frac{P(\text{effect}|\text{cause})P(\text{cause})}{P(\text{effect})}$$

- Example:

- M: meningitis, S: stiff neck

$$\left. \begin{aligned} P(+m) &= 0.0001 \\ P(+s|+m) &= 0.8 \\ P(+s|-m) &= 0.01 \end{aligned} \right\} \text{Example givens}$$

$$P(+m|+s) = \frac{P(+s|+m)P(+m)}{P(+s)} = \frac{P(+s|+m)P(+m)}{P(+s|+m)P(+m) + P(+s|-m)P(-m)} = \frac{0.8 \times 0.0001}{0.8 \times 0.0001 + 0.01 \times 0.999}$$

- Note: posterior probability of meningitis still very small: 0.008
- Note: you should still get stiff necks checked out! Why?

# Quiz: Bayes' Rule

- Given:

$$P(W)$$

| R    | P   |
|------|-----|
| sun  | 0.8 |
| rain | 0.2 |

$$P(D|W)$$

| D   | W    | P   |
|-----|------|-----|
| wet | sun  | 0.1 |
| dry | sun  | 0.9 |
| wet | rain | 0.7 |
| dry | rain | 0.3 |

- What is  $P(W | \text{dry})$  ?

| W    | $P(W   \text{dry})$   |
|------|---|
| sun  | $P(\text{sun} \text{dry}) = \frac{P(\text{dry} \text{sun})P(\text{sun})}{P(\text{dry})} = \frac{P(\text{dry} \text{sun})P(\text{sun})}{P(\text{dry} \text{sun})P(\text{sun}) + P(\text{dry} \text{rain})P(\text{rain})} = \frac{0.9 * 0.8}{0.9 * 0.8 + 0.3 * 0.2} \approx 0.923$      |
| rain | $P(\text{rain} \text{dry}) = \frac{P(\text{dry} \text{rain})P(\text{rain})}{P(\text{dry})} = \frac{P(\text{dry} \text{rain})P(\text{rain})}{P(\text{dry} \text{sun})P(\text{sun}) + P(\text{dry} \text{rain})P(\text{rain})} = \frac{0.3 * 0.2}{0.9 * 0.8 + 0.3 * 0.2} \approx 0.077$ |

# Ghostbusters, Revisited

- Let's say we have two distributions:
  - Prior distribution** over ghost location:  $P(G)$ 
    - Let's say this is uniform
  - Sensor reading model:  $P(R | G)$ 
    - Given: we know what our sensors do
    - $R$  = reading color measured at  $(1,1)$
    - E.g.  $P(R = \text{yellow} | G=(1,1)) = 0.1$
- We can calculate the **posterior distribution**  $P(G | r)$  over ghost locations given a reading using Bayes' rule:

$$P(g|r) \propto P(r|g)P(g)$$

|      |      |      |
|------|------|------|
| 0.11 | 0.11 | 0.11 |
| 0.11 | 0.11 | 0.11 |
| 0.11 | 0.11 | 0.11 |

|       |      |      |
|-------|------|------|
| 0.17  | 0.10 | 0.10 |
| 0.09  | 0.17 | 0.10 |
| <0.01 | 0.09 | 0.17 |

# Independence

- Two variables are *independent* in a joint distribution if:

$$P(X, Y) = P(X)P(Y)$$

$$X \perp\!\!\!\perp Y$$

$$\forall x, y P(x, y) = P(x)P(y)$$

- Says the joint distribution *factors* into a product of two simple ones
  - Usually variables aren't independent!
- Can use independence as a *modeling assumption*
    - Independence can be a simplifying assumption
    - Empirical* joint distributions: at best "close" to independent
    - What could we assume for {Weather, Traffic, Cavity}?
- Independence is like something from CSPs: what?

# Example: Independence?

$$P_1(T, W)$$

| T    | W    | P   |
|------|------|-----|
| hot  | sun  | 0.4 |
| hot  | rain | 0.1 |
| cold | sun  | 0.2 |
| cold | rain | 0.3 |

$$P(T)$$

| T    | P                 |
|------|-------------------|
| hot  | $0.4 + 0.1 = 0.5$ |
| cold | $0.2 + 0.3 = 0.5$ |

$$P(W)$$

| W    | P                 |
|------|-------------------|
| sun  | $0.4 + 0.2 = 0.6$ |
| rain | $0.1 + 0.3 = 0.4$ |

$$P_2(T, W) = P(T)P(W)$$

| T    | W    | P                 |
|------|------|-------------------|
| hot  | sun  | $0.5 * 0.6 = 0.3$ |
| hot  | rain | $0.5 * 0.4 = 0.2$ |
| cold | sun  | $0.5 * 0.6 = 0.3$ |
| cold | rain | $0.5 * 0.4 = 0.2$ |

# Example: Independence

- N fair, independent coin flips:

$P(X_1)$

|   |     |
|---|-----|
| H | 0.5 |
| T | 0.5 |

$P(X_2)$

|   |     |
|---|-----|
| H | 0.5 |
| T | 0.5 |

...

$P(X_n)$

|   |     |
|---|-----|
| H | 0.5 |
| T | 0.5 |

$P(X_1, X_2, \dots, X_n)$

$2^n$

# Conditional Independence

# Conditional Independence

- $P(\text{Toothache}, \text{Cavity}, \text{Catch})$
- If I have a cavity, the probability that the probe catches in it doesn't depend on whether I have a toothache:
  - $P(+\text{catch} \mid +\text{toothache}, +\text{cavity}) = P(+\text{catch} \mid +\text{cavity})$
- The same independence holds if I don't have a cavity:
  - $P(+\text{catch} \mid +\text{toothache}, -\text{cavity}) = P(+\text{catch} \mid -\text{cavity})$
- Catch is *conditionally independent* of Toothache given Cavity:
  - $P(\text{Catch} \mid \text{Toothache}, \text{Cavity}) = P(\text{Catch} \mid \text{Cavity})$
- Equivalent statements:
  - $P(\text{Toothache} \mid \text{Catch}, \text{Cavity}) = P(\text{Toothache} \mid \text{Cavity})$
  - $P(\text{Toothache}, \text{Catch} \mid \text{Cavity}) = P(\text{Toothache} \mid \text{Cavity}) P(\text{Catch} \mid \text{Cavity})$
  - One can be derived from the other easily

# Conditional Independence

- Unconditional (absolute) independence very rare (why?)
- *Conditional independence* is our most basic and robust form of knowledge about uncertain environments.
- X is conditionally independent of Y given Z

if and only if:

$$\forall x, y, z : P(x, y|z) = P(x|z)P(y|z)$$

or, equivalently, if and only if

# Conditional Independence

- What about this domain:

- Traffic
- Umbrella
- Raining

$$T \perp U | R$$

# Conditional Independence

- What about this domain:

- Fire
- Smoke
- Alarm

$$A \perp\!\!\!\perp F | S$$

# Conditional Independence and the Chain Rule

- Chain rule:  $P(X_1, X_2, \dots, X_n) = P(X_1)P(X_2|X_1)P(X_3|X_1, X_2) \dots$

- Trivial decomposition:

$$P(\text{Traffic, Rain, Umbrella}) = P(\text{Rain})P(\text{Traffic}|\text{Rain})P(\text{Umbrella}|\text{Rain, Traffic})$$

- With assumption of conditional independence:

$$P(\text{Traffic, Rain, Umbrella}) = P(\text{Rain})P(\text{Traffic}|\text{Rain})P(\text{Umbrella}|\text{Rain})$$

- Bayes' nets / graphical models help us express conditional independence assumptions

# Ghostbusters Chain Rule

$$P(T,B,G) = P(G) P(T | G) P(B | T, G)$$

(assuming conditional independence)

$$P(T,B,G) = P(G) P(T|G) P(B|G)$$

- Each sensor depends only on where the ghost is
- That means, the two sensors are conditionally independent, given the ghost position
- T: Top square is red  
B: Bottom square is red  
G: Ghost is in the top

- Givens:  
 $P(+g) = 0.5$   
 $P(-g) = 0.5$   
 $P(+t | +g) = 0.8$   
 $P(+t | -g) = 0.4$   
 $P(+b | +g) = 0.4$   
 $P(+b | -g) = 0.8$

| T  | B  | G  | P(T,B,G) |
|----|----|----|----------|
| +t | +b | +g | 0.16     |
| +t | +b | -g | 0.16     |
| +t | -b | +g | 0.24     |
| +t | -b | -g | 0.04     |
| -t | +b | +g | 0.04     |
| -t | +b | -g | 0.24     |
| -t | -b | +g | 0.06     |
| -t | -b | -g | 0.06     |
