ADT vs. data structure

- **Abstract Data Type (ADT)**
 - A collection of data and a set of operations on that data
 - Why is it "abstract"?
 - Doesn't specify implementation details
 - Just describes what the type can do
 - You can use without knowing internal workings
 - e.g. Stack, Queue, SymbolTable, List, SortedList
- **Data structure**
 - How the data type is implemented in software
 - e.g. array, linked list, linked graph

3

Overview

- **Terminology**
 - Abstract Data Types (ADT)
 - Data structures
- **Stack ADT**
 - Last-in first-out (LIFO)
- **Queue ADT**
 - First-in first-out (FIFO)

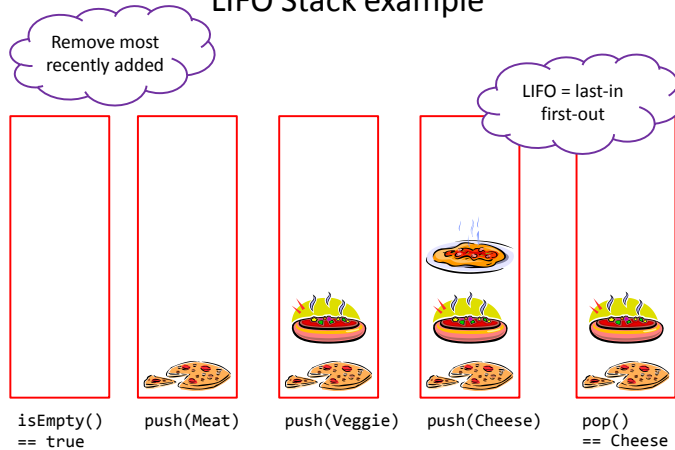

2

Collections

- **Collection: A common data type for storing data**
 - Allow users to **insert** item
 - Allow users to **remove** item, but *which one?*
 - Allow users to see if the collection is **empty**
- **List**
 - Remove at **specified position**
 - e.g. Java's ArrayList class
- **Stack**
 - Remove the **most recently added** = LIFO (Last-In First-Out)
 - e.g. trays in the cafeteria
- **Queue**
 - Remove the **least recently added** = FIFO (First-In First-Out)
 - e.g. line at the grocery store
- **Symbol Table**
 - Remove item **with a given key**
 - e.g. phone book, mapping a name to a phone number

4

LIFO Stack example

5

LIFO Stack API

```
public class StackOfStrings
-----
    StackOfStrings() // Construct a new stack
    void push(String s) // Add a new string to the queue
    String pop() // Remove the most recently added string
    boolean isEmpty() // Check if the queue is empty
```

6

LIFO Stack example 1

- **Goal: Reverse all the words in a file**
 - "glory is fleeting but obscurity is forever" →
 - "forever is obscurity but fleeting is glory"
- **Approach:**
 - Use a Stack ADT as implemented by StackOfStrings
 - Read a word, push on stack
 - Repeat until out of words
 - Pop from stack, output word
 - Repeat until stack empty

7

Reverse words on standard input

```
public class ReverseWords
{
    public static void main(String [] args)
    {
        StackOfStrings stack = new StackOfStrings();

        while (!StdIn.isEmpty())
            stack.push(StdIn.readString());

        while (!stack.isEmpty())
            System.out.print(stack.pop() + " ");

        System.out.println();
    }
}
```

Create an instance of a Stack data type. Notice we don't specify a size, class promises to handle any size.

Next word goes on top of the stack that contains all the previously read in words.

Start peeling off words starting with the last one pushed on top of the stack.

8

LIFO Stack example 2

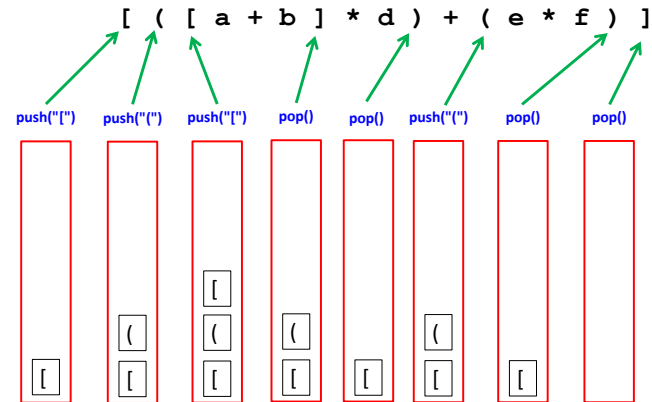

- Goal: Check for balanced ()'s and []'s

$[((a + b) * d) + (e * f)] \rightarrow$ balanced
 $[([a + b] * d) + (e * f)] \rightarrow$ balanced
 $[((a + b) * d) + (e * f)] \rightarrow$ unbalanced
 $(a + b) * d) + (e * f) \rightarrow$ unbalanced
 $[((a + b) * d) + (e * f)] \rightarrow$ unbalanced

- Approach:

- Use a Stack ADT as implemented by StackOfStrings
- If token is (or [push onto stack
- If token is), pop stack and make sure popped value is (
- If token is], pop stack and make sure popped value is [
- Anything other token, ignore

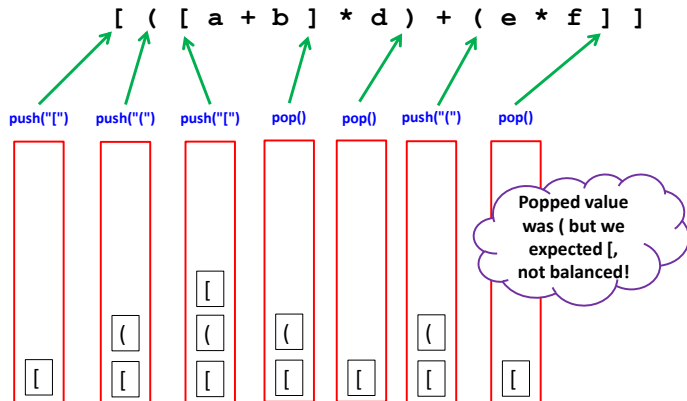

Balanced, success

9

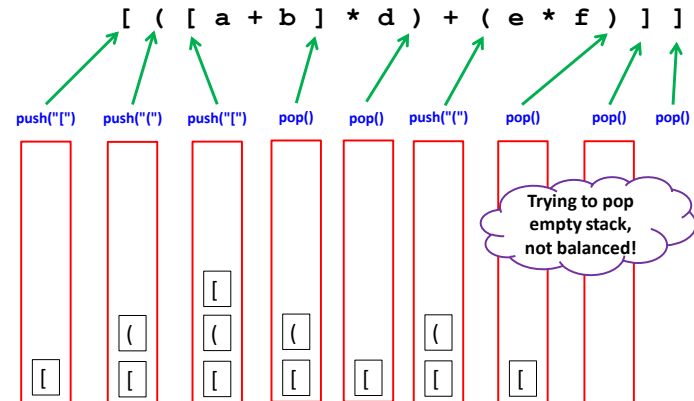

10

Balanced, failure 1

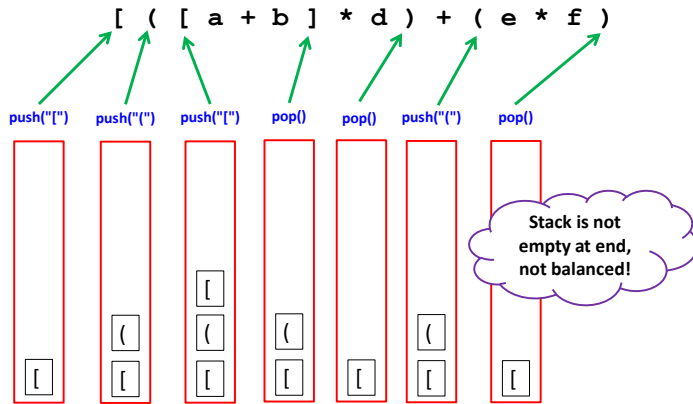

11

Balanced, failure 2

12

Balanced, failure 3

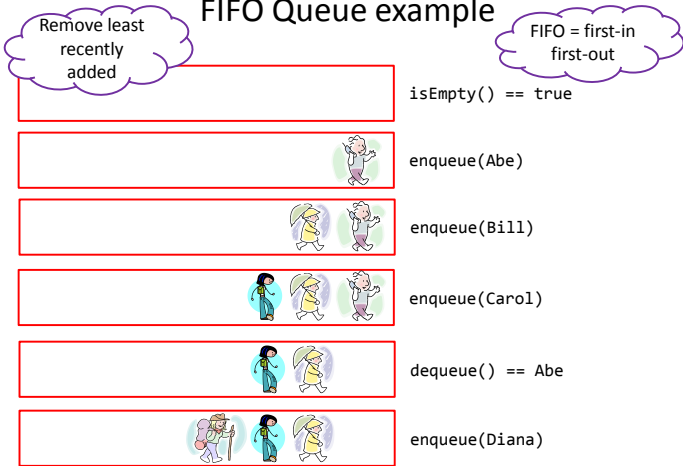

13

```
public static void main(String [] args)
{
    StackOfStrings stack = new StackOfStrings();
    while (!StdIn.isEmpty())
    {
        String token = StdIn.readString();
        if ((token.equals("(") || (token.equals("(")))
        {
            stack.push(token);
        }
        else if (token.equals(")"))
        {
            if ((stack.isEmpty() || (!stack.pop().equals("(")))
            {
                System.out.println("Not balanced");
                return;
            }
        }
        else if (token.compareTo("+") == 0)
        {
            if ((stack.isEmpty() || (!stack.pop().equals("(")))
            {
                System.out.println("Not balanced");
                return;
            }
        }
    }
    if (stack.isEmpty())
        System.out.println("Balanced");
    else
        System.out.println("Not balanced");
}
```

Balanced.java

14

FIFO Queue example

15

FIFO Queue API

```
public class QueueOfStrings
{
    QueueOfStrings() // Construct a new queue
    void enqueue(String s) // Add a new string to the queue
    String dequeue() // Remove the least recently added string
    boolean isEmpty() // Check if the queue is empty
}
```

16

FIFO Queue example

- **Goal: Parental spelling obfuscation aid**
 - "After the kids go to sleep let's have some..."
 - Parent types "cookies" into computer
 - Computer spells out each letter, "c--o--o--k--i--e--s"
 - Pausing one second between letters
- **Approach:**
 - Use a Queue ADT as implemented by QueueOfStrings
 - Queue a each new letter as it is typed
 - Delay 1s before dequeue'ing
 - Display letter
 - Play WAV audio file

17

```
public static void main(String[] args)
{
    StdDraw.setFont(new Font("SansSerif", Font.BOLD, 120));
    int delay = 0;
    QueueOfStrings queue = new QueueOfStrings();

    while (true)
    {
        if (StdDraw.hasNextKeyTyped())
        {
            char key = StdDraw.nextKeyTyped();
            if ((key >= 'a') && (key <= 'z'))
                queue.enqueue("" + key);
        }
        StdDraw.show(100);
        delay += 100;

        if (delay >= 1000)
        {
            delay = 0;
            StdDraw.clear();
            if (!queue.isEmpty())
            {
                String letter = queue.dequeue();
                StdDraw.text(.5, .5, letter);
                StdAudio.play(letter + ".wav");
            }
        }
    }
}
```

Speller.java

Create an instance of a Queue data type. Notice we don't specify a size, class promises to handle any size.

Latest character goes at the back of the line. All other character have to play first.

Play the character that has been waiting the longest in the queue.

18

Summary

- **Abstract Data Types (ADTs)**
 - A collection of data and operations on that data
 - **FIFO Stack**
 - Push and pop items, always pops the last thing pushed
 - Examples: reversing words in a sentence, check for balanced parameters
 - **LIFO Queue**
 - Enqueue and dequeue items
 - Always dequeue the thing that has been waiting the longest
 - Examples: tracking and eventually servicing asynchronous events (keys typed by parent)
- **Data structures**
 - Implementation of an ADT (there may be many ways!)
 - Implementation of a Stack with a fixed size

19
