

Recursion II

Outline

- Recursion

- A method calling itself
 - ✦ A new way of thinking about a problem
 - ✦ A powerful programming paradigm

- Examples:

- Last time:
 - ✦ Factorial, binary search, H-tree, Fibonacci
- Today:
 - ✦ Greatest Common Divisor (GCD)
 - ✦ Brownian Motion
 - ✦ Sorting

[illegible]

Recursion Walkthrough

```
public class RecursiveMystery
{
    public static void mystery(int n)
    {
        System.out.println(n);
        if (n <= 0)
            return;          //Pop
        mystery(n - 1);      //Push
        mystery(n - 2);      //Push
    } //Pop

    public static void main(String[] args)
    {
        mystery(3);          //Push
    } //Pop
}
```

Call Stack	n
	3
mystery(3)	

Recursion Walkthrough

```
public class RecursiveMystery
{
    public static void mystery(int n)
    {
        System.out.println(n);
        if (n <= 0)
            return;          //Pop
        mystery(n - 1);      //Push
        mystery(n - 2);      //Push
    } //Pop

    public static void main(String[] args)
    {
        mystery(3);          //Push
    } //Pop
}
```

Call Stack	n
	2
mystery(3-1)	3
mystery(3)	

3

Recursion Walkthrough

```
public class RecursiveMystery
{
    public static void mystery(int n)
    {
        System.out.println(n);
        if (n <= 0)
            return;          //Pop
        mystery(n - 1);      //Push
        mystery(n - 2);      //Push
    } //Pop

    public static void main(String[] args)
    {
        mystery(3);          //Push
    } //Pop
}
```

Brownian Motion

- Models many natural and artificial phenomenon

- Motion of pollen grains in water

- Price of stocks

- Rugged shapes of mountains and clouds

Simulating Brownian Motion

- Midpoint displacement method:
 - Track interval (x_0, y_0) to (x_1, y_1)
 - Choose δ displacement randomly from Gaussian
 - Divide in half, $x_m = (x_0 + x_1)/2$ and $y_m = (y_0 + y_1)/2 + \delta$
 - Recur on the left and right intervals

Recursive Midpoint Displacement Algorithm

```
void curve(double x0, double y0, double x1, double y1, double var)
{
    if (x1 - x0 < .005)
    {
        StdDraw.Line(x0, y0, x1, y1);
        return;
    }

    double xm = (x0 + x1) / 2.0;
    double ym = (y0 + y1) / 2.0;

    ym = ym + StdRandom.gaussian(0, Math.sqrt(var));

    curve(x0, y0, xm, ym, var / 2.0);
    curve(xm, ym, x1, y1, var / 2.0);
}
```

← base case

← reduction step

Plasma Cloud

- Same idea, but in 2D
 - Each corner of square has some color value
 - Divide into four sub-squares
 - New corners: avg of original corners, or all 4 + random
 - Recur on four sub-squares

Brownian Landscape

Divide and Conquer

- Divide and conquer paradigm
 - Break big problem into small sub-problems
 - Solve sub-problems recursively
 - Combine results
- Used to solve many important problems
 - Sorting things, mergesort: $O(N \log N)$
 - Parsing programming languages
 - Discrete FFT, signal processing
 - Multiplying large numbers
 - Traversing multiply linked structures (stay tuned)

“Divide et impera. Vendi, vidi,
vici.”
-Julius Caesar

Divide and Conquer: Sorting

- Goal: Sort by number, ignore suit, aces high

Approach

- 1) Split in half (or as close as possible)
- 2) Give each half to somebody to sort
- 3) Take two halves and merge together

Unsorted pile #1

Unsorted pile #2

EXAMPLES

Approach

- 1) Split in half (or as close as possible)
- 2) Give each half to somebody to sort
- 3) Take two halves and merge together

Sorted pile #1

Sorted pile #2

Merging

Take card from whichever pile has lowest card

EXAMPLES

Approach

- 1) Split in half (or as close as possible)
- 2) Give each half to somebody to sort
- 3) Take two halves and merge together

Sorted pile #1

Sorted pile #2

EXAMPLES

Approach

- 1) Split in half (or as close as possible)
- 2) Give each half to somebody to sort
- 3) Take two halves and merge together

Sorted pile #1

Sorted pile #2

EXAMPLES

Approach

- 1) Split in half (or as close as possible)
- 2) Give each half to somebody to sort
- 3) Take two halves and merge together

Sorted pile #1

Sorted pile #2

EXAMPLES

Approach

- 1) Split in half (or as close as possible)
- 2) Give each half to somebody to sort
- 3) Take two halves and merge together

Sorted pile #1

Sorted pile #2

EXAMPLES

Approach

- 1) Split in half (or as close as possible)
- 2) Give each half to somebody to sort
- 3) Take two halves and merge together

Sorted pile #1

Sorted pile #2

EXAMPLES

Approach

- 1) Split in half (or as close as possible)
- 2) Give each half to somebody to sort
- 3) Take two halves and merge together

Sorted pile #1

Sorted pile #2

EXAMPLES

Approach

- 1) Split in half (or as close as possible)
- 2) Give each half to somebody to sort
- 3) Take two halves and merge together

Sorted pile #1

Sorted pile #2

EXAMPLES

Approach

- 1) Split in half (or as close as possible)
- 2) Give each half to somebody to sort
- 3) Take two halves and merge together

Sorted pile #1

Sorted pile #2

EXAMPLES

Approach

- 1) Split in half (or as close as possible)
- 2) Give each half to somebody to sort
- 3) Take two halves and merge together

Sorted pile #1

Sorted pile #2

How many operations to do the merge?

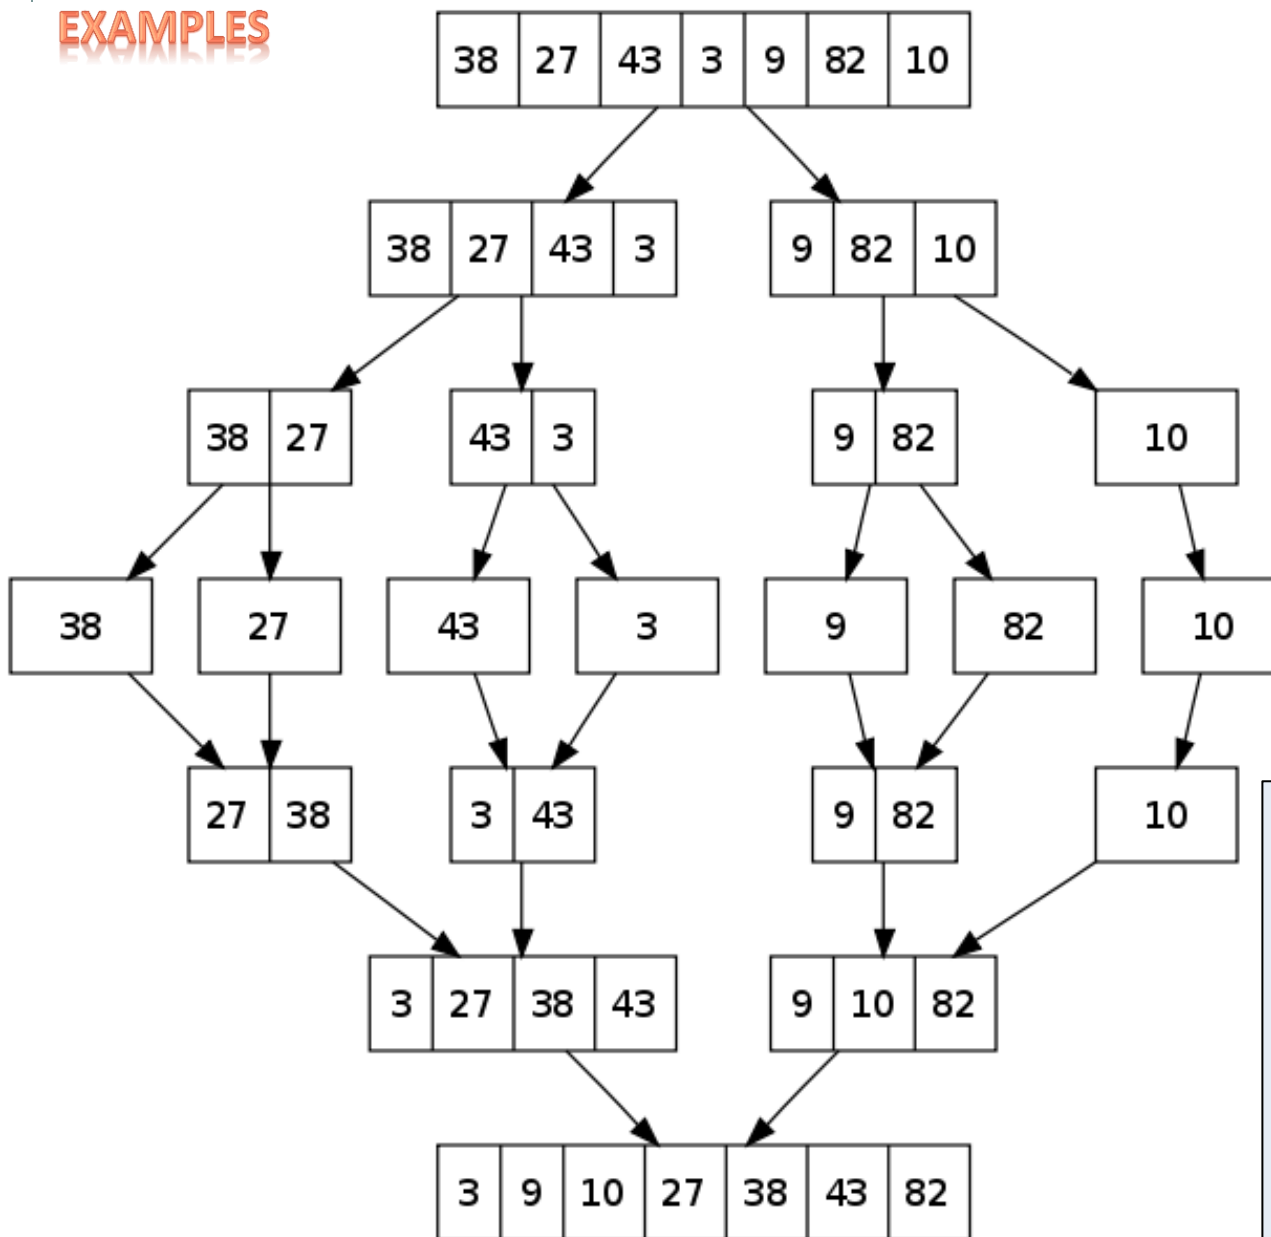

Linear in the number of cards, $O(N)$

But how did pile 1 and 2 get sorted?

Recursively of course!

Split each pile into two halves, give to different people to sort.

EXAMPLES

How many split levels?

$O(\log_2 N)$

How many merge levels?

$O(\log_2 N)$

Operations per level?

$O(N)$

Total operations?

$O(N \log_2 N)$

Summary

- **Recursion**

- A method calling itself:
 - ✦ Sometimes just once, e.g. binary search
 - ✦ Sometimes twice, e.g. mergesort
 - ✦ Sometimes multiple times, e.g. H-tree
- All good recursion must come to an end:
 - ✦ Base case that does NOT call itself recursively
- A powerful tool in computer science:
 - ✦ Allows elegant and easy to understand algorithms
 - ✦ (Once you get your head around it)
