

# LIGHTING

# OUTLINE

- Learn to light/shade objects so their images appear three-dimensional
- Introduce the types of light-material interactions
- Build a simple reflection model---the Phong model--- that can be used with real time graphics hardware
- Introduce modified Phong model
- Consider computation of required vectors

# WHY WE NEED SHADING

- Suppose we build a model of a sphere using many polygons and color it with **glColor**. We get something like

- But we want

# SHADING

- Why does the image of a real sphere look like

- Light-material interactions cause each point to have a different color or shade
- Need to consider
  - Light sources
  - Material properties
  - Location of viewer
  - Surface orientation

# SCATTERING

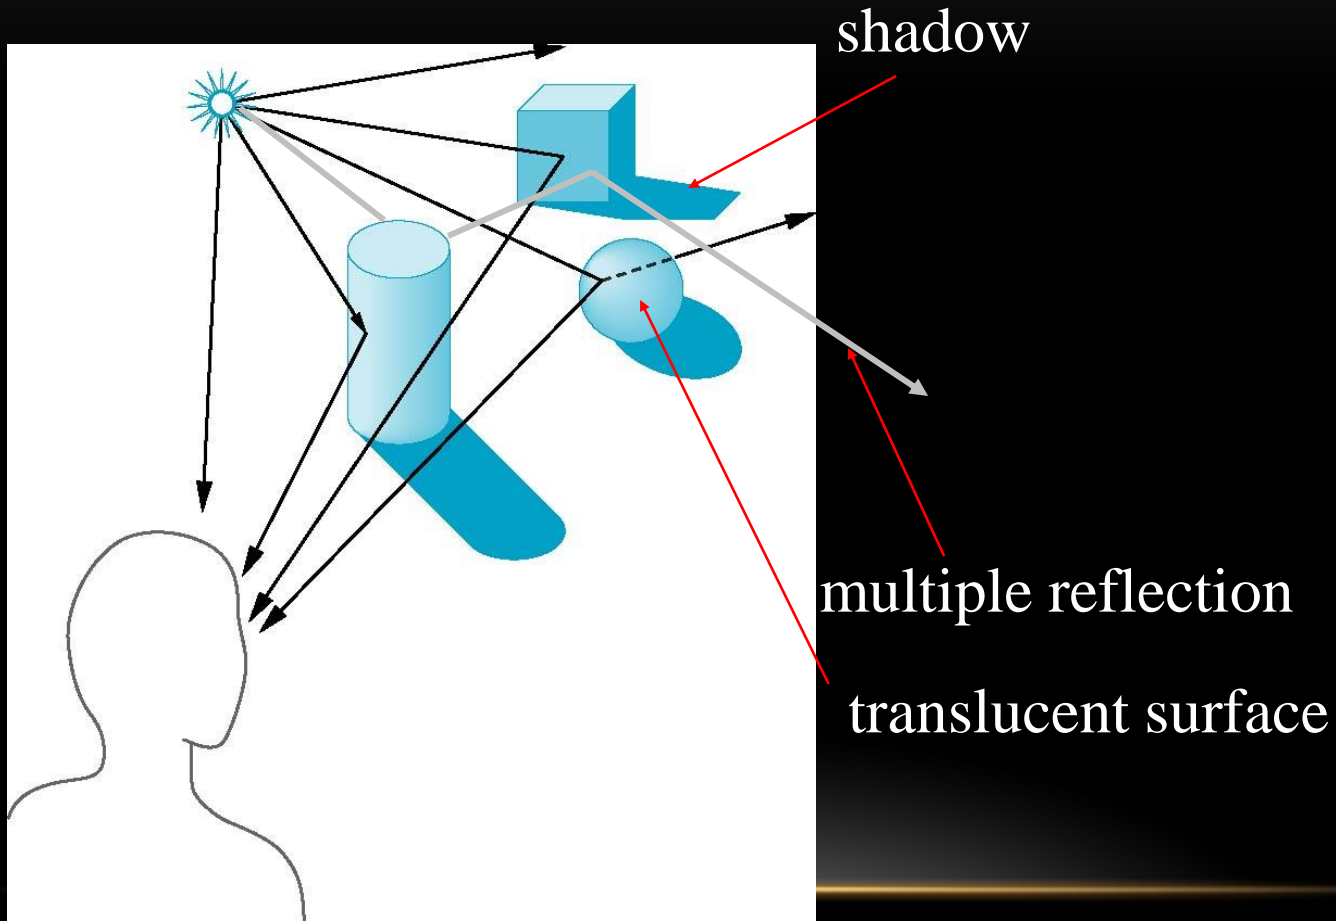

- Light strikes A
  - Some scattered
  - Some absorbed
- Some of scattered light strikes B
  - Some scattered
  - Some absorbed
- Some of this scattered light strikes A
  - and so on

# RENDERING EQUATION

- The infinite scattering and absorption of light can be described by the *rendering equation*
  - Cannot be solved in general
  - Ray tracing is a special case for perfectly reflecting surfaces
- Rendering equation is global and includes
  - Shadows
  - Multiple scattering from object to object

# GLOBAL EFFECTS

# LOCAL VS GLOBAL RENDERING

- Correct shading requires a global calculation involving all objects and light sources
  - Incompatible with pipeline model which shades each polygon independently (local rendering)
- However, in computer graphics, especially real time graphics, we are happy if things “look right”
  - Many techniques exist for approximating global effects

# LIGHT-MATERIAL INTERACTION

- Light that strikes an object is partially absorbed and partially scattered (reflected)
- The amount reflected determines the color and brightness of the object
  - A surface appears red under white light because the red component of the light is reflected and the rest is absorbed
- The reflected light is scattered in a manner that depends on the smoothness and orientation of the surface

# LIGHT SOURCES

General light sources are difficult to work with because we must integrate light coming from all points on the source

# SIMPLE LIGHT SOURCES

- Point source
  - Model with position and color
  - Distant source = infinite distance away (parallel)
- Spotlight
  - Restrict light from ideal point source
- Ambient light
  - Same amount of light everywhere in scene
  - Can model contribution of many sources and reflecting surfaces

# SURFACE TYPES

- The smoother a surface, the more reflected light is concentrated in the direction a perfect mirror would reflect the light
- A very rough surface scatters light in all directions

smooth surface

rough surface

# PHONG MODEL

- A simple model that can be computed rapidly
- Has three components
  - Diffuse
  - Specular
  - Ambient
- Uses four vectors
  - To source
  - To viewer
  - Normal
  - Perfect reflector

# IDEAL REFLECTOR

- Normal is determined by local orientation
- Angle of incidence = angle of reflection
- The three vectors must be coplanar

$$\mathbf{r} = 2 (\mathbf{l} \cdot \mathbf{n}) \mathbf{n} - \mathbf{l}$$

# LAMBERTIAN SURFACE

- Perfectly diffuse reflector
- Light scattered equally in all directions
- Amount of light reflected is proportional to the vertical component of incoming light
  - reflected light  $\sim \cos \theta_i$
  - $\cos \theta_i = \mathbf{l} \cdot \mathbf{n}$  if vectors normalized
  - There are also three coefficients,  $k_r$ ,  $k_b$ ,  $k_g$  that show how much of each color component is reflected

# SPECULAR SURFACES

- Most surfaces are neither ideal diffusers nor perfectly specular (ideal reflectors)
- Smooth surfaces show specular highlights due to incoming light being reflected in directions concentrated close to the direction of a perfect reflection

specular  
highlight

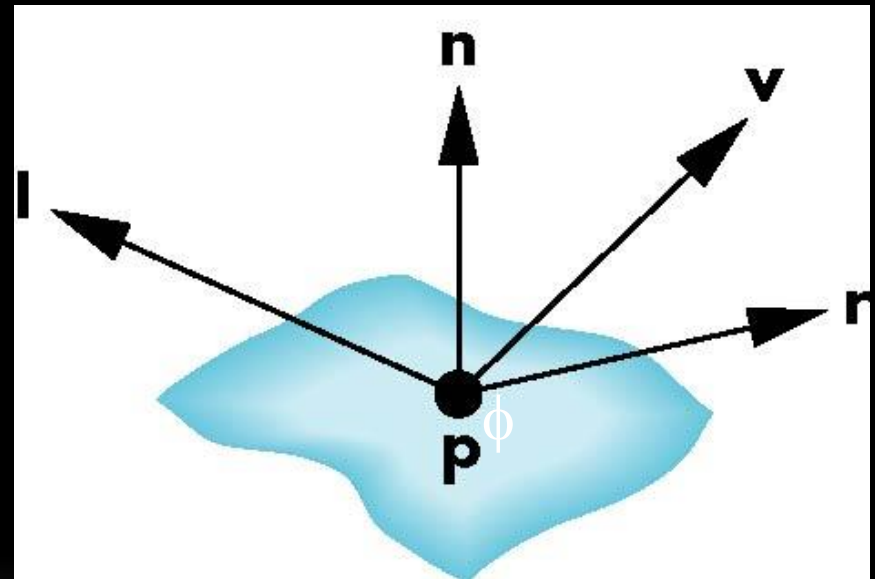

# MODELING SPECULAR REFLECTIONS

- Phong proposed using a term that dropped off as the angle between the viewer and the ideal reflection increased

$$I_s \sim k_s I \cos^\alpha \phi$$

reflected intensity      shininess coef  
incoming intensity      reflection coef

# THE SHININESS COEFFICIENT

- Values of  $\alpha$  between 100 and 200 correspond to metals
- Values between 5 and 10 give surface that look like plastic

# AMBIENT LIGHT

- Ambient light is the result of multiple interactions between (large) light sources and the objects in the environment
- Amount and color depend on both the color of the light(s) and the material properties of the object
- Add  $k_a I_a$  to diffuse and specular terms

reflection coef

intensity of ambient light

# DISTANCE TERMS

- The light from a point source that reaches a surface is inversely proportional to the square of the distance between them
- We can add a factor of the form  $1/(a + bd + cd^2)$  to the diffuse and specular terms
- The constant and linear terms soften the effect of the point source

# LIGHT SOURCES

- In the Phong Model, we add the results from each light source
- Each light source has separate diffuse, specular, and ambient terms to allow for maximum flexibility even though this form does not have a physical justification
- Separate red, green and blue components
- Hence, 9 coefficients for each point source
  - $I_{dr}, I_{dg}, I_{db}, I_{sr}, I_{sg}, I_{sb}, I_{ar}, I_{ag}, I_{ab}$

# MATERIAL PROPERTIES

- Material properties match light source properties
  - Nine absorption coefficients
    - $k_{dr}$ ,  $k_{dg}$ ,  $k_{db}$ ,  $k_{sr}$ ,  $k_{sg}$ ,  $k_{sb}$ ,  $k_{ar}$ ,  $k_{ag}$ ,  $k_{ab}$
  - Shininess coefficient  $\alpha$

## ADDING UP THE COMPONENTS

For each light source and each color component, the Phong model can be written (without the distance terms) as

$$I = k_d I_d \mathbf{l} \cdot \mathbf{n} + k_s I_s (\mathbf{v} \cdot \mathbf{r})^\alpha + k_a I_a$$

For each color component we add contributions from all sources

# MODIFIED PHONG MODEL

- The specular term in the Phong model is problematic because it requires the calculation of a new reflection vector and view vector for each vertex
- Blinn suggested an approximation using the halfway vector that is more efficient

# THE HALFWAY VECTOR

- $\mathbf{h}$  is normalized vector halfway between  $\mathbf{l}$  and  $\mathbf{v}$

$$\mathbf{h} = (\mathbf{l} + \mathbf{v}) / |\mathbf{l} + \mathbf{v}|$$

# USING THE HALFWAY VECTOR

- Replace  $(\mathbf{v} \cdot \mathbf{r})^\alpha$  by  $(\mathbf{n} \cdot \mathbf{h})^\beta$
- $\beta$  is chosen to match shininess
- Note that halfway angle is half of angle between  $\mathbf{r}$  and  $\mathbf{v}$  if vectors are coplanar
- Resulting model is known as the modified Phong or Phong-Blinn lighting model

# EXAMPLE

Only differences in these teapots are the parameters in the modified Phong model

# COMPUTATION OF VECTORS

- $\mathbf{l}$  and  $\mathbf{v}$  are specified by the application
- Can compute  $\mathbf{r}$  from  $\mathbf{l}$  and  $\mathbf{n}$
- Problem is determining  $\mathbf{n}$
- For simple surfaces it can be determined but how we determine  $\mathbf{n}$  differs depending on underlying representation of surface
- OpenGL leaves determination of normal to application

# COMPUTING REFLECTION DIRECTION

- Angle of incidence = angle of reflection
- Normal, light direction and reflection direction are coplaner
- Want all three to be unit length

$$r = 2(l \cdot n)n - l$$

# PLANE NORMALS

- Equation of plane:  $ax+by+cz+d = 0$
- From Chapter 4 we know that plane is determined by three points  $p_0, p_1, p_2$  or normal  $\mathbf{n}$  and  $p_0$
- Normal can be obtained by

$$\mathbf{n} = (p_2 - p_0) \times (p_1 - p_0)$$

# NORMAL TO SPHERE

- Implicit function  $f(x,y,z)=0$
- Normal given by gradient
- Sphere  $f(\mathbf{p})=\mathbf{p}\cdot\mathbf{p}-1$
- $\mathbf{n} = [\partial f/\partial x, \partial f/\partial y, \partial f/\partial z]^T = \mathbf{p}$

# GENERAL CASE

- We can compute parametric normals for other simple cases
  - Quadrics
  - Parametric polynomial surfaces
    - Bezier surface patches

# SUMMARY

- Learn to light/shade objects so their images appear three-dimensional
- Introduce the types of light-material interactions
- Build a simple reflection model---the Phong model--- that can be used with real time graphics hardware
- Introduce modified Phong model
- Consider computation of required vectors
