

1. Give an example of two artifacts that share an intra-artifact relationship, and describe that relationship.

A database script may relate to one version of the code. System modifications may have changed the database, so the old script only runs on the old code.

Tests may only be run on previous versions.

2. The text divides configuration management systems into 3 tiers, with the 1st tier simply providing version and change control.

- a. What support is added in tier 2?

Build support like make files.

- b. What support is added in tier 3?

Software development support.
